Medium			+
Short	(NOAA)	+	+

Revisit Time

Objectives

An aerial photograph of a wildfire. A yellow firefighting aircraft is seen in the upper right, releasing a stream of water or retardant. Below, a fire engine is positioned on the right, with a long hose extending across the foreground. The landscape is a mix of charred ground, smoke, and some green trees. The sky is filled with thick, billowing smoke.

Higher spatial resolution

Short revisit time

Prevention of exponential growth

Provide more information to firefighting services

Need for Spatial Precision

House

Wind Dir

Fire

Need for Spatial Precision

Wind Dir

Fire

House

Need for Early Detection Before Exponential Growth

30 minutes

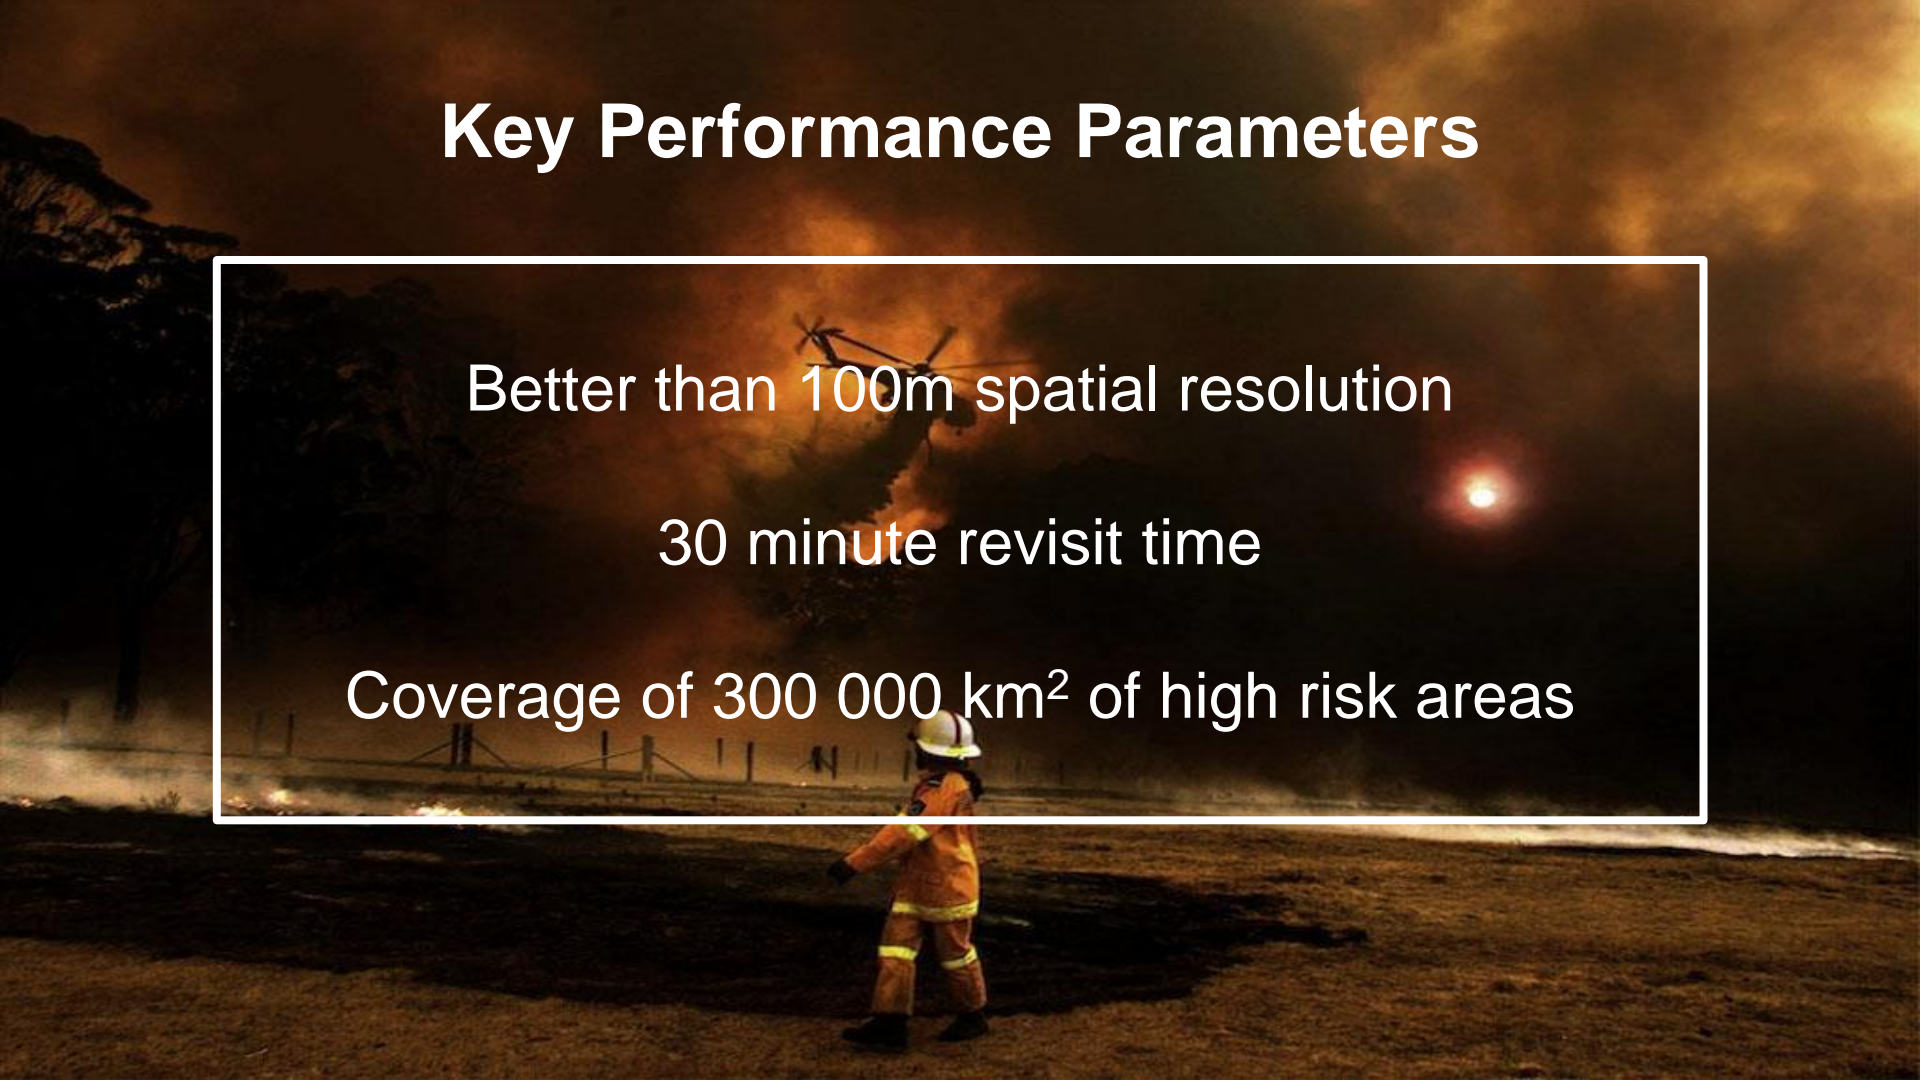

Key Performance Parameters

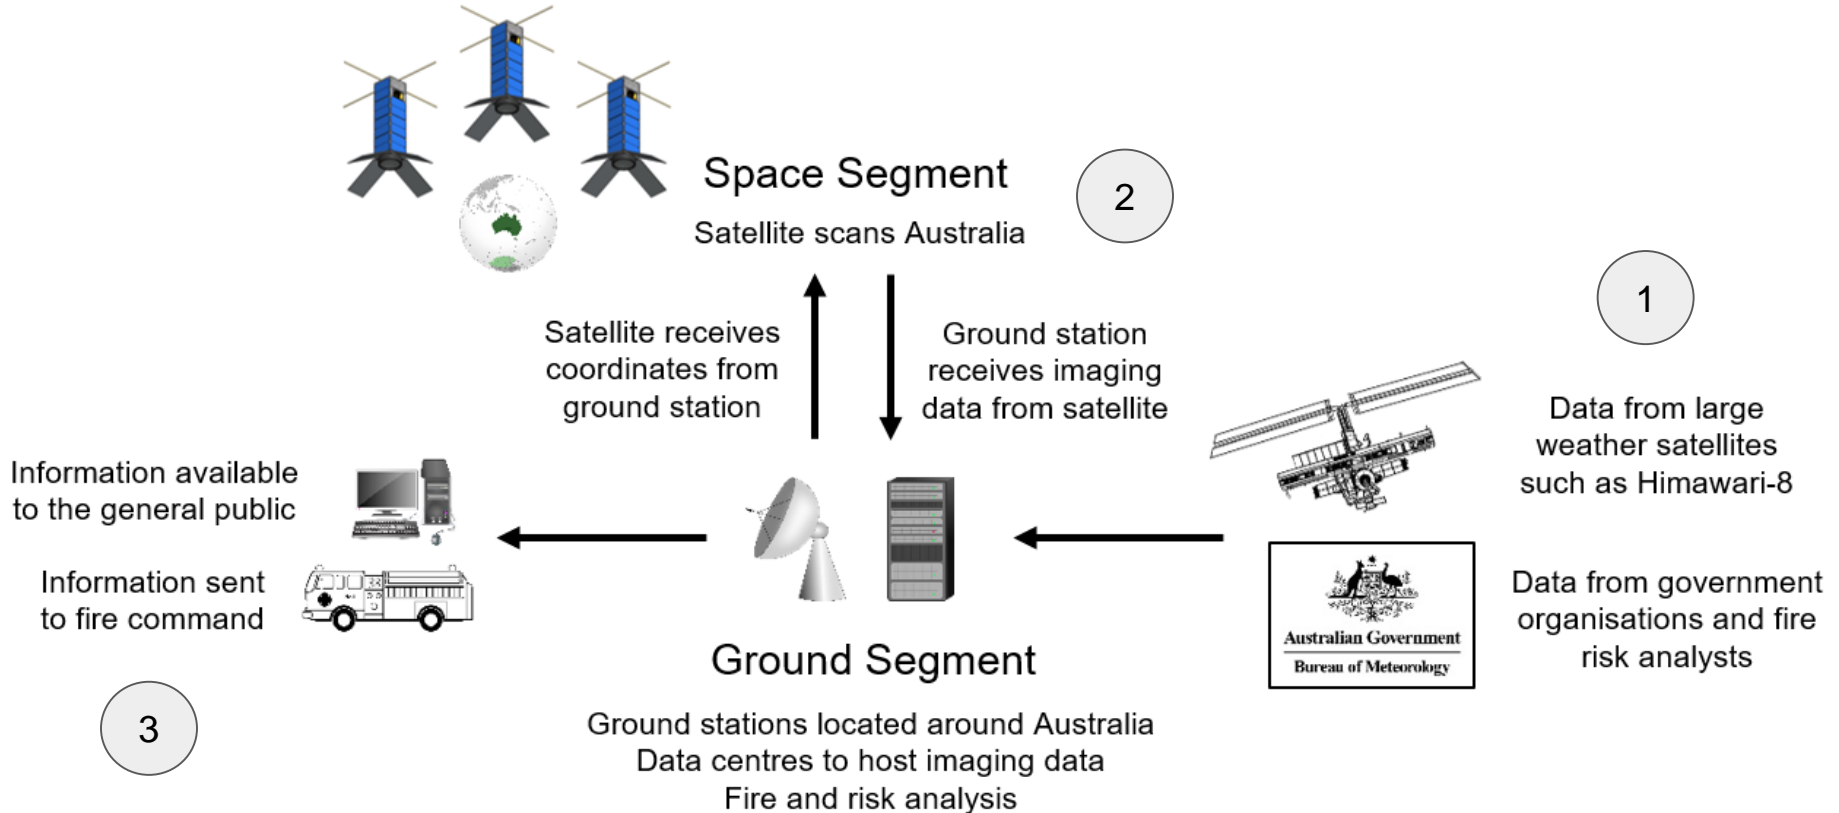

Better than 100m spatial resolution

30 minute revisit time

Coverage of 300 000 km² of high risk areas

Concept of Operations

Space Segment

Imaging Payload

Sensor

- nBn sensor for mid-wave infrared sensing
- higher resolution than mature sensor technologies (pixel pitch of $12\ \mu\text{m}$)
- COTS, but needs space environmental testing

Lens

- Wide aperture 200mm IR lens (physical length $\sim 126\text{mm}$)
- Single focus (as imaging at $>$ twice the hyper-focal distance, light is collimated)

Quazir HD Hot Camera Core

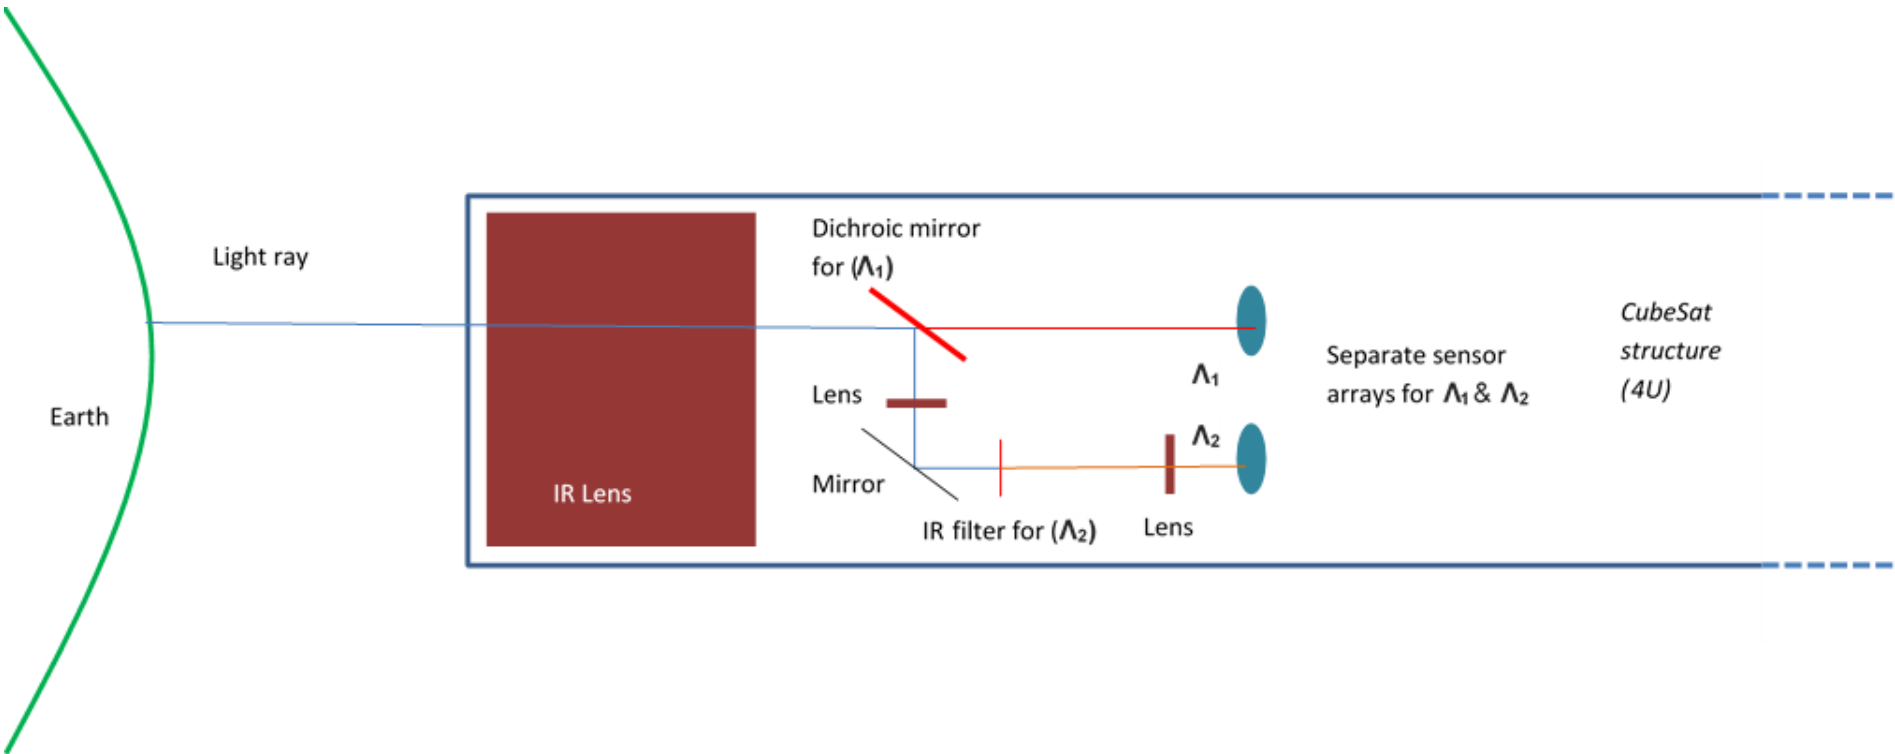

Spatial Resolution (Key Performance Parameter)

	<i>Parameter</i>	<i>Value</i>
Sensor	Pixel pitch	12 μ m
	Pixel array size	1280*1024
Lens	Focal length	200mm
	Diameter	110mm
Orbit	Altitude	561.24km

Considering the Rayleigh criterion for diffraction limited resolution at 2.9 μ m gives:

- **Ground Sampling Distance (Resolution) - 87m**
- Swath Size - 100 km x 90 km

Multispectral Imaging Option

Other Major Components

ADCS - Hyperion iADCS 100, 3 axis control with 1 degree of accuracy

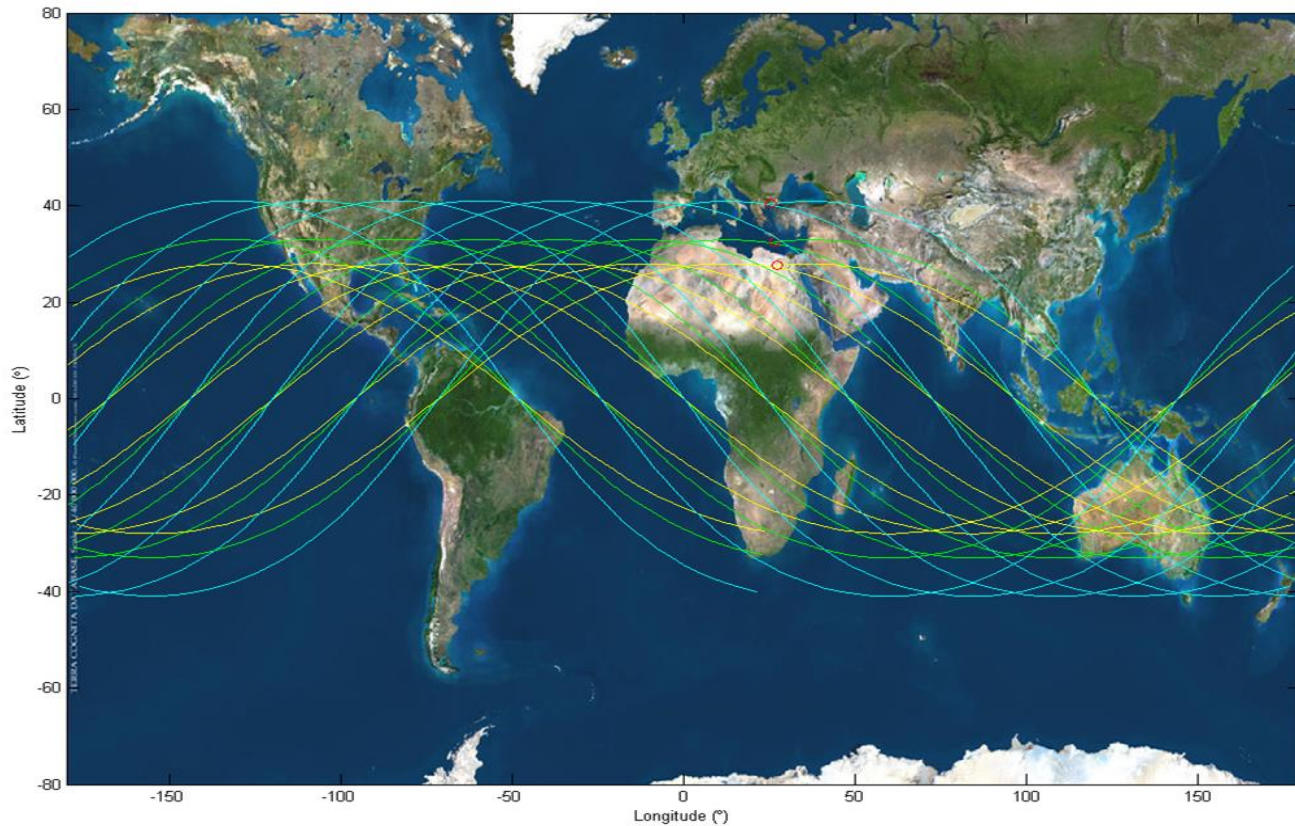

OBDH - S-band 1Mbps transfer with 64GB storage

Power - Pumpkin Solar Panels (4U fixed, 3U deployable)

- *Generation*: 22W (average)
- *Usage*: 10W during downlink, 12W during imaging

Propulsion - Busek pulsed plasma thruster

Orbit Description

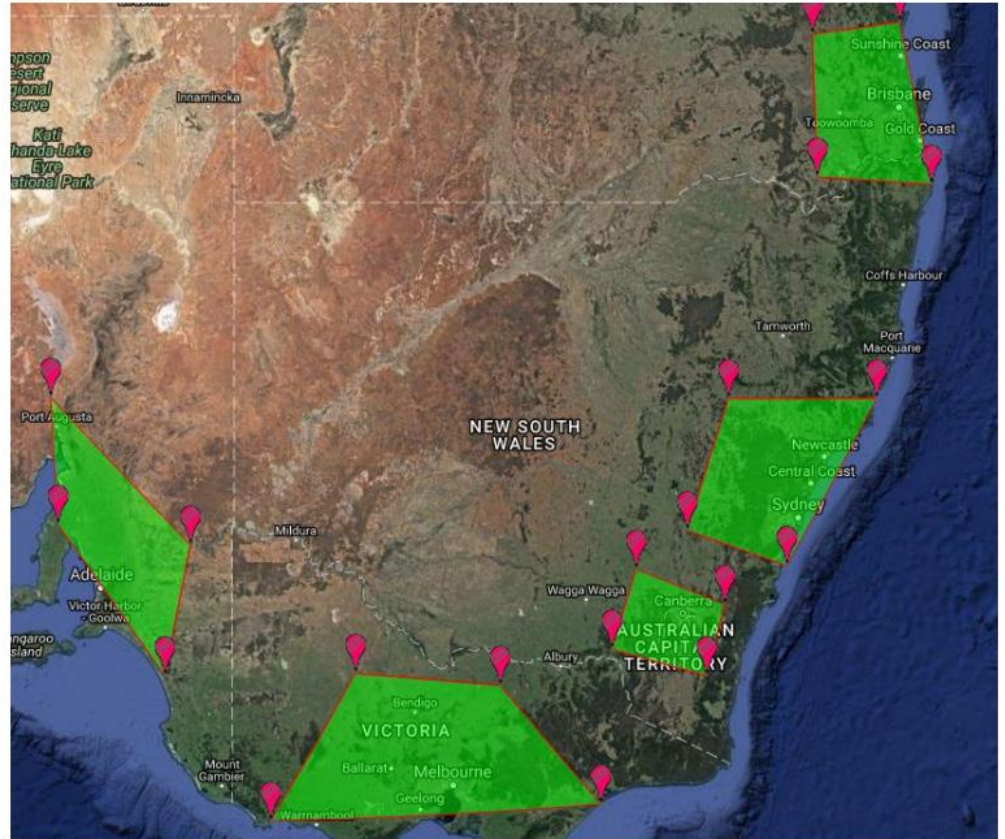

Altitude: 561.25km

A possible inclination configuration chosen to cover the east coast of Australia

Revisit Time and Coverage

Key high risk target zones near metropolitan and semi-urban areas

Total prioritised imaging area of 300,000km²

Revisit Time (Key Performance Parameter)

1. Define coverage areas.
2. Estimate area each satellite will sweep on each pass.
3. Assume 25% of imaging area is redundant.

48 satellites yields revisit time of 18 min

Propulsion System

Pulsed plasma thruster with 140 grams of PTFE fuel gives total $\Delta V = 170\text{m/s}$.

Altitude maintenance - requires $\Delta V \sim 3\text{m/s/yr}$

De-orbit - ΔV of 120m/s required to reach mean altitude of 250km.

Deorbit

Deorbiting from 560km altitude with apogee centred burn arcs.

Trip time = 30 days

Implementation

Project Management

Ground Stations

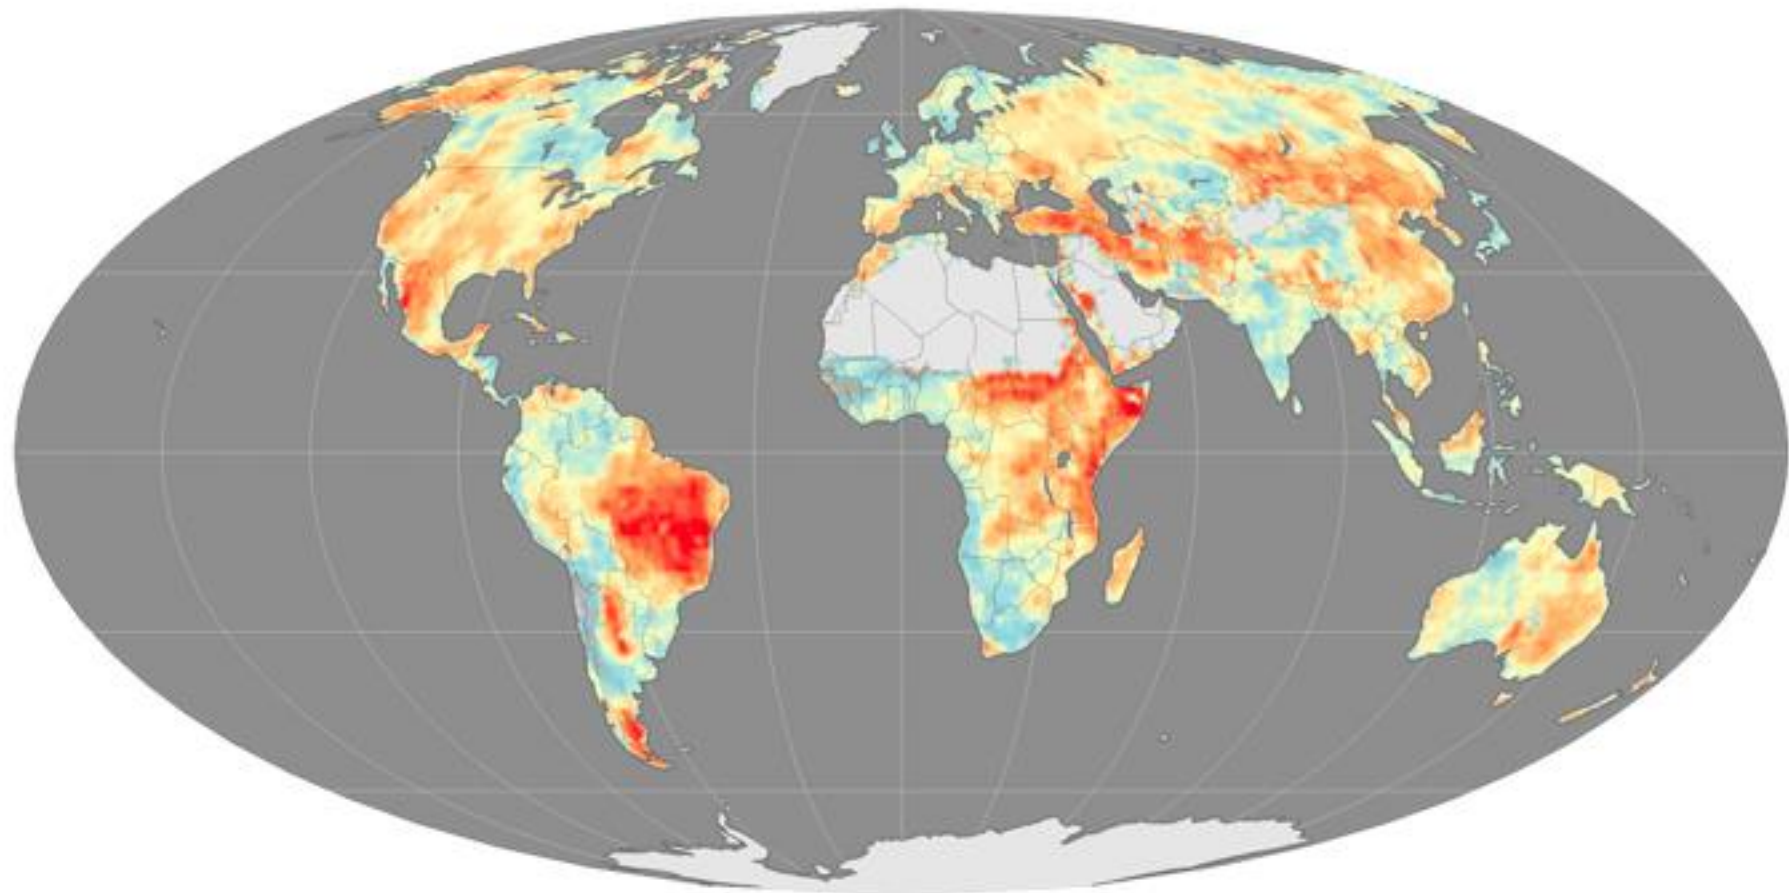

Public Information

Life Cycle Cost

Parameter	Cost (AUD \$)
Personnel and management (over initial 2 years)	2,500,000
Ground station equipment	250,000
COTS components and build (48 CubeSats)	6,000,000
Launch (300kg class)	8,000,000
Total	20,000,000
Life Cycle Cost (per year, after initial period)	2,000,000

Change in Frequency of Long Fire Weather Seasons (%)

Appendix Slide - Revisit Time

1. Define coverage areas
2. Estimate area each satellite will sweep on each pass (A_{ij}).

3.
$$T_{rep} = \frac{60 \times 24 \times A_{req}}{R_f \sum_{i=1}^N \sum_{j=1}^{p_i} A_{i,j}},$$

where p_i to be the number of passes the i th satellite makes over the imaging area and R_f is the redundancy factor, a measure of how much imaged data area is not important.
